SUMMARY OF TABLES.

In 1899 there were received 38,937 applications for patents, 2,400 applications for designs, 106 applications for reissues, 2,059 applications for registration of trade-marks, 629 applications for registration of labels, and 143 applications for registration of prints. There were 25,435 patents granted, including designs, 92 patents reissued, 1,649 trade-marks registered, and 511 labels and 100 prints. The number of patents that expired was 18,135. The number of allowed applications awaiting the payment of final fees was 8,037. The number that were forfeited for non-payment of the final fees was 3,997. The total expenditures were $1,211,783.73. The receipts over expenditures were $113,673.30. The total balance to the credit of the Patent Office in the Treasury of the United States on January 1, 1900, was $5,086,649.64.

In proportion to population more patents were issued to citizens of Connecticut than to those of any other State—1 to every 945 inhabitants. Next in order are the following: District of Columbia, 1 to every 1,151; Massachusetts, 1 to every 1,262; Rhode Island, 1 to every 1,270; Oklahoma Territory, 1 to every 1,344; New Jersey, 1 to every 1,455; Montana, 1 to every 1,474; New York, 1 to every

1,579; Colorado, 1 to every 1,604; California, 1 to every 1,652. The fewest patents granted in proportion to the number of inhabitants were in the following states: South Carolina, 1 to every 25,024; North Carolina, 1 to every 21,012; Alabama, 1 to every 17,195; Georgia, 1 to every 14,025, and Mississippi, 1 to every 13,574.

As to foreign patents, 1,072 patents were granted to residents of England; 888 to those of Germany; 371 to those of Canada; France, 292; Austria-Hungary, 100; Scotland, 83; Switzerland, 72; Belgium, 65; Sweden, 45; Victoria, 43; New Zealand, 41; New South Wales, 32; Ireland, 27; Russia, 25; Italy, 23; Denmark, 20; Mexico, 14; Netherlands, 13; South Australia, 10; South African Republic and Western Australia, 7 each; Norway, 6; Argentina, Queensland, and Tasmania, 5 each; India and Jamaica, 4 each; Finland, Japan, and Java, 3 each; Guatemala, Peru, Turkey, and Uruguay, 2 each, and Algeria, Bermuda, Brazil, Bulgaria, Cape Colony, Chile, China, Danish West Indies, Dutch West Indies, Egypt, Island of Tahiti, Spain, Sumatra, Trinidad, and Venezuela, 1 each.

THE WORK OF THE OFFICE.

The examining work of the Office has been kept well in hand during the year. On December 27, 1898, there were 5,467 applications awaiting action, while on December 26, 1899, 5,392 applications were awaiting action. On December 27, 1898, two divisions were examining applications filed within one month thirty-three divisions those filed within two months, and one division those filed within three months, while on December 26, 1899, thirty-three divisions were examining applications filed within one month, and three divisions those filed within two months. At both dates substantially all of the divisions were taking up amended cases for action within fifteen days after the amendments were filed.

This is a most excellent showing when the disadvantages under which the work is being done are taken into account. The lack of suitable room greatly hampers and unnecessarily delays the work in many divisions.

During the year the work of the clerical divisions has been kept well in hand. The work of furnishing printed copies of specifications and drawings of patents has been placed under the control of one person, and the system adopted by him has been such that single copies have been much more promptly furnished and the class orders are now being filled within a week, where a year ago they were often not filled within three months. With sufficient room to properly arrange these printed copies orders for them could be filled almost as soon as received.

THE CLASSIFICATION DIVISION.

In my annual report for the calendar year 1898 I stated that a classification division had been organized, but that the work had not progressed far enough to enable the Office to determine the best system in all of its details. I am now able to report progress and outline the system adopted.

During the present year considerable progress has been made in the work, but owing to the lack of room the work has been hampered, as it will continue to be until additional space becomes available, as it will when the General Land Office removes from the Patent Office building.

One of the first steps taken was to rearrange the original drawings of all patents in numerical order. The object of this was to economize our storage space and to make it possible to find any given patent at a moment's notice. Formerly the drawings were arranged by subclasses, and as it was necessary to know the classification of a patent before it could be found a long search was often necessitated. The first ten thousand patents had no numbers and were identified only by name and date. This involved additional labor to properly arrange them. The numerical arrangement of the original drawings of nearly seven hundred thousand patents and trade-marks has been completed and lists of patents issued without drawings, and of drawings which have not been found are now being made. When this is completed, the patents for which there are no drawings will be represented by dummies containing the number of the patent and a statement as to whether there were any drawings or whether the same have been lost. These dummies will be filed in their appropriate relation with the original drawings for the purpose of preserving the record.

The classification proper has meanwhile been carried on. One division consisting of eight main classes has been completely classified, and from one to three classes in nine other divisions have been completely or partially classified.

The following plan of classification has been adopted:

Under the provisions of section 4886 of the Revised Statutes a patent is to be granted only when the invention was not known or used by others nor patented or described in any printed publication prior to the invention thereof by the applicant. To ascertain these facts, a search must be made.

The present field of search, which increases greatly every year, consists of about 700,000 United States patents, 1,250,000 foreign patents, and 74,000 volumes of scientific works in the Patent Office Library.

It is the object of classification to reduce this immense mass of matter to classes and subclasses of convenient size, capable of clear separation and definition and based upon a system sufficiently elastic to provide for future growth. Without such classification it would be impossible to examine the 40,000 applications filed annually or to make searches of sufficient accuracy to justify the treatment of a patent as *prima facie* evidence of its validity. Inability to make accurate searches also renders uncertain property rights to the amount of millions of dollars and menaces the security of all manufacturing interests based upon patents.

The first and most difficult step in classification is the separation of the subject-matter into main classes of a character that will bring together such

inventions as are *similar in structure* and *analogous in their use*, both of which elements are essential in their citation as references in the rejection of an application for a patent.

In order that there may be certainty in placing a patent in its proper class, the first rule to be observed is that wherever there is liability to conflict between two or more classes one will be fixed upon as the *superior class* and all the others which are related thereto will be treated as *inferior classes*. This being settled, all patents which *contain more than one invention* or which cover a construction which *combines in a single apparatus or machine* the subject-matter of two or more classes are placed in the *superior class*, and when necessary the *inferior classes* are completed by placing therein copies of these patents, which are known as *cross-references*.

The various kinds of main classes are as follows and rank according to number:

MACHINES.

1. Combination-machines, or such as perform more than one operation; 7. Functional-machine classes, which are defined by the character of the operation performed; 6. Material-machine classes, which are limited to operation upon some particular material; 4. Article-machine classes, which are used solely in the making of a specific article and incapable, without considerable change, of any broader or more general use; 5. Functional-material-machine classes, which are functional machines limited further by the material operated upon; 3. Functional-article-machine classes, which are functional machines limited to the making of a specific article; 2. Material-article-machine classes, which are material classes limited to the making of a specific article; 8. Machine elements, which are mechanical movements or parts which may be found in any class of complete machines.

ARTICLES OF MANUFACTURE.

Articles of manufacture are divided into (1) Finished articles, (2) Structural materials, and (3) Compositions of matter, ranking in the order named. They are only occasionally numerous enough to constitute main classes and are generally grouped according to their function or use and placed in classes with the machines for making them.

PROCESSES OR METHODS.

Processes or methods are divided into (1) Machine processes and (2) Article processes, according as they are most closely related to the machine or the product, and they are placed in the same classes with them.

Having formed proper main classes, the material is next separated into finer divisions, called "subclasses."

The following table indicates the method of dividing a class into subclasses, the figures at the left, under the column headed "Rank," indicating the order of their superiority and determining the placing of doubtful and mixed patents:

Diagram of Patent Office classification.

	11						Machine processes—classified with Machine.

The subclasses into which Articles of Manufacture and Processes are divided will be readily understood without further explanation than has already been given.

The machines composing the class will be divided into General utility and Special-article-making machines, the subclasses of Special-article-making machines being superior to those of the General-utility group, as indicated by the figures on the left. Each of these groups is then divided into Combination and Single-operation machines, the meaning of which has been before explained. The combination-machine classes are distinguished by titles indicating the number and character of the operations performed, as "Turning and sawing," "Boring and tenoning," &c.

The Single-operation machines of the General-utility group are divided into subclasses ranking as follows: Miscellaneous; Structural-type subclasses, which are complete machines of a definite type, as "Horizontal boring mills;" Major-structure subclasses, which are important portions of a machine, and Minor-structure subclasses, which are less important parts and which may be included in the superior subclasses.

The machines, both Combined and Single-operation, of the Special-article, making, group are formed into Art classes, their names indicating the article made, as "Clothes-pin machines."

As the numbers in the "Rank" column indicate the relative superiority of the subclasses of the forms shown in the table, they serve as a guide in placing the mixed patents which always go, in case of conflict, into that one of the subclasses involved

which has the lowest number and are cross-referenced into the others.

As an example of an actual class divided into subclasses according to this table, the following has been made up of extracts drawn from a recently completed class and containing an example of each type of subclass described. The numbers in the "Rank" column are those which the subclasses bear in the completed class, but correspond relatively to those in the former table.

CROSS-REFERENCING.

Cross-referencing, as before explained, when necessitated by mixed matter, is always from the *lowest-numbered or superior* subclass into the *inferior or higher-numbered* one.

In some cases cross-referencing is necessary because certain structural features are common to two or more classes or subclasses, and in these cases it may be carried in either or both directions, as desired.

SEARCH-CARDS.

When it would be necessary to cross-reference a considerable portion of one subclass into another, a *search-card* is used instead. This is a card stamped with the title of the subclass in which it is to be placed and containing printed directions to search any other subclasses from which cross-references would otherwise have been drawn.

PRESERVATION OF CLASSIFICATION.

In order that lost copies of patents may be replaced in the files used in searching by the Examiner and the public and to prevent unauthorized changes in the classification, the following records are made:

After a patent has been classified, and also when a new patent is issued, it is stamped by the Classification Division with the number and title of its appropriate class and subclass. A card is then prepared giving the number of the patent and the name of the inventor, and this also is stamped with the proper class and subclass. When brought together in their proper subclasses, these cards constitute a subclass card-index, which will enable the Classification Division to check up any subclass and replace any lost copies. Each of these cards also shows whether the patent is cross-referenced into other subclasses, and the patent is represented in those subclasses by a similar card headed with the word "Cross-Reference."

A numerical list of all the patents issued is also kept in the Classification Division, and the classification of each patent as soon as it is made is entered on this list, so that it can always be ascertained where any patent is placed.

If the classification of any patent is to be changed, the Classification Division is notified, and, if the change is approved, will make a new subclass-card, destroy the old one, and change the classification on the numerical list. As all changes must be made and all stamping done by the Classification Division, no unauthorized changes can occur.

Printed publications will not be taken up until the patents are all reclassified, except in the case of chemical bodies and compositions of matter, which are being embodied in a card-index, and which will be a valuable supplement to the patent classification.

ROOM.

The expectation expressed in my last annual report that "in a few months some additional room will be placed at our disposal" has not yet been realized. The work of the Office in all of its branches is hampered by the lack of necessary room. Even when the General Land Office vacates the Patent Office building, room sufficient for the necessary work of the Office will not be available. The business of this Office increases from year to year, and consequently the necessity for more space, especially for storage purposes, cannot be too strongly emphasized. Some of these records constitute the legal evidence of title of many of the large manufacturing industries of the country, while others disclose the proceedings in this Office when the applications for the issued patents were pending, and it is self-evident that all of these should be preserved in a fireproof building. Their loss would work an incalculable injury not alone to the owners of the patents, but the public in general.

The American Society of Mechanical Engineers, The Patent Bar Association of Chicago, The National Association of Agricultural Implement and Vehicle Manufacturers, as well as other organizations and individuals, have forcefully called to the attention of your honorable bodies the necessity for such a building.

I commend to your careful consideration and heartily approve of Senate Bill No. 1,159, which provides for the construction of a "fireproof building, for the use and accommodation of the Patent Office of the United States, including a Hall of Inventions."

It is now almost universally recognized that this country owes a debt of gratitude to its inventors and progressive manufacturers. In view of the well-known fact that the inventors of the country have paid all of the expenses of carrying on the Patent Office and that this Office has covered into the Treasury over five millions of dollars in excess of all expenditures, no more fitting way of recognizing the value of the patent system to the country can be found than by using this money for the erection of a suitable building in which the business of the Office can be conveniently and safely carried on, and at the same time giving ample space for illustrating the growth of the industrial arts by means of suitable models.

THE SCIENTIFIC LIBRARY.

The efficiency and accuracy of the work of this Office depend to a considerable degree upon its library. It should be kept abreast of the progress in the mechanical and manufacturing arts of the day, and to that end ample appropriations should be made. For years the appropriation for this library has been inadequate. Every effort made to increase it has failed, and authority has been denied to the Commissioner of Patents to dispose of such publications therein contained as are of no special value in its special field and to use the proceeds in the purchase of modern works. No sound reason can be advanced why this authority should not be given.

DESIRED LEGISLATION.

Nothing has impressed me more forcibly during the two years in which I have occupied the position of Commissioner of Patents than the advisability and necessity of limiting the number of appeals in "merit" and "interference" cases. Under the present statutes if an application is rejected by the Principal Examiner an appeal lies to the Board of Examiners-in-Chief, and from that tribunal to the Commissioner of Patents in person, and from him to the Court of Appeals of the District of Columbia.

In interference proceedings the appeals are the same, save that the first appeal is from the Examiner of Interferences. These various appeals necessarily delay the issue of patents, whereby the rights of the public are prejudiced in that the monopoly does not begin to run until the actual issue of patent. The applicants for patents are put to heavy expenses, which to many are a grievous burden.

In my opinion there should be but one appeal in the Patent Office and no appeal to the Court of Appeals of the District of Columbia. The reason why there should be no appeal to the court is that under section 4915 of the Revised Statutes the applicant to whom a patent is refused can prosecute his application in another court and an aggrieved party in an interference proceeding can renew his contest in another court.

I suggest an amendment to the statutes by which the Board of Examiners-in-Chief be abolished and that in their place and in the place of the present Assistant Commissioner there be three Assistant Commissioners appointed who, together with the Commissioner, shall be persons of competent legal knowledge, scientific ability, and well versed in patent law and shall hear all appeals from the Primary Examiner and Examiner of Interferences. The Commissioner, with any two of the Assistant Commissioners or the three Assistant Commissioners, shall have the power to review and determine upon all adverse decisions made by the Principal Examiners upon applications for patents and for reissue patents and of the decisions of the Examiner of Interferences on all questions relating to priority of invention. Such a system will lead to an early decision of the question, limit the number of appeals, thereby relieving inventors from an unnecessary burden, and will end the anomalous condition which now exists, in that one person—the Commissioner of Patents—reviews the decisions made by a board composed of three. Under the present statutes the decisions of the Board of Examiners-in-Chief have not that force and effect that they ought, for the reason that all their decisions are not final and are largely treated in "merit" cases as only applying to the case in hand. The Assistant Commissioners should be appointed for a definite term of years, say six, (the first appointments, however, to be respectively for two, four, and six years.)

While the question of politics manifestly should not and does not to any extent enter into the conduct of the Patent Office, yet in order to overcome any objections that might be offered on that score provision might be made that not more than two of them should be appointed from the same political party.

In view of the fact that aside from the judicial duties of the Commissioner he has to perform executive duties, it may be urged that he should be in harmony with the Administration, and therefore it may be thought best that no change in the manner of his appointment be made.

A bill embodying these features has been introduced, and its enactment as a law will, in my opinion, be beneficial to the patent system.

At the present time an application can be kept alive in the Office for an indefinite number of years, although there is no good reason why at least ninety per cent. of all patents cannot be issued within one year after filing applications therefor. The practice of keeping applications pending in the Patent Office is, in my opinion, reprehensible, as it certainly does not promote the progress of invention, but rather tends to stifle it. If an application does not become involved in an interference, it should not be permitted to remain in the Patent Office more than three years without abridging its life of seventeen years. Were it not for the number of appeals, all interferences could be disposed of within that time. To meet any case of unusual hardship, discretion might be lodged with the Commissioner of Patents to extend the proposed limit of three years.

The Trade-Mark Statutes should be amended so

as to provide for the registration of trade-marks used in interstate commerce. Other amendments are required; but as this subject is being dealt with by the commission appointed in 1898 I refrain from making any further suggestions upon this point.

I am informed that the commissioners appointed under act of Congress approved June 4, 1898, to revise the statutes relating to patents, trade and other marks, &c., recently submitted to Congress a preliminary report comprising a large number of documents bearing on the treaties and conventions between the United States and foreign nations regarding patents and trade-mark protection on some special features of foreign patent and trade-mark laws and on the history of trade-mark legislation in the United States.

I understand that this preliminary report is to be followed shortly by a full report which will include a review of the arrangements entered into between the United States and foreign nations and between foreign nations with respect to patents and trade-marks, of foreign patent and trade-mark laws, and of trade-mark protection in the United States, and will include propositions for such changes in the statutes as are required to give effect to treaty stipulations, as well as such changes as will incorporate into our laws such provisions of foreign patent and trade-mark laws as are deemed advantageous to the public interest and in harmony with our institutions. A feature of this report which is of particular interest will be a proposed revision of the trade-mark law to provide for the registration of trade-marks used in interstate commerce and to encourage a more general registration of trade-marks by reducing the registration fee.

President McKinley in his annual message of December 5, 1899, says:

> Our future progress and prosperity depend upon our ability to equal, if not surpass, other nations in the enlargement and advance of science, industry, and commerce. To invention we must turn as one of the most powerful aids to the accomplishment of such a result.

May not our inventors hopefully look to the Fifty-sixth Congress for aid and effectual encouragement in improving the American patent system?

Respectfully submitted,

C. H. DUELL,
Commissioner.
